Project: Import Data using Transform Maps (Spreadsheet)

Platform: ServiceNow | Document: Phase 5 - Project Development

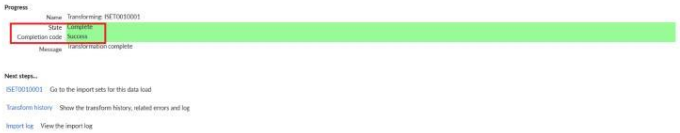

---

Phase 5: Project Development

Building the Import

With the table, Import Set, and Transform Map designed and planned in earlier phases, development consisted of executing the pipeline end-to-end:

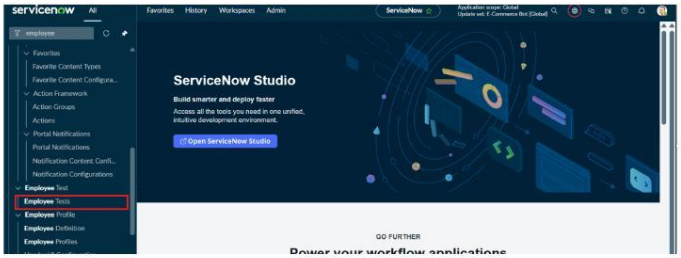

- The spreadsheet was uploaded through Load Data, creating Import Set records in u_employee_import.
- The Transform Map 'Sample Spreadsheet Import' was opened and the Transform action was run against the loaded Import Set.
- ServiceNow processed all 15 rows and reported a successful completion.

Phase 5: Transform Data & Validate

Navigation:

- Open Employee Test Table from application navigator as shown below.

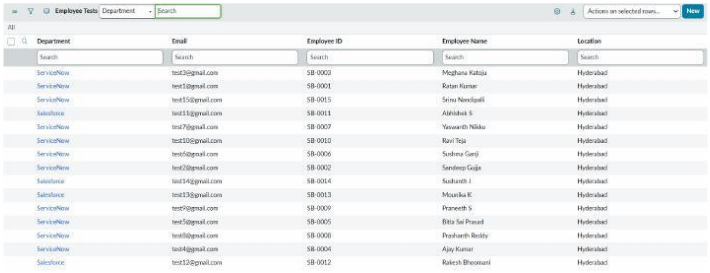

- As our import got succeeded, all the records are created in the Employee Test Table.

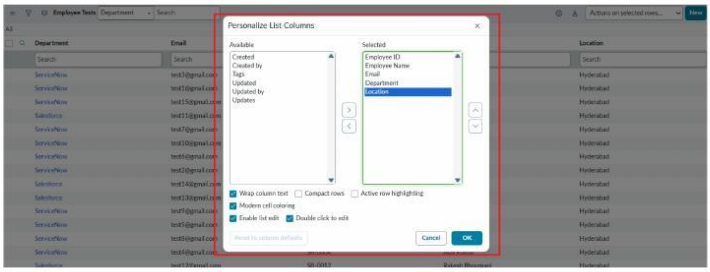

Transform run confirming completion, with a link through to the Employee Test table.

Verifying the Build

The Employee Test table was opened from the Application Navigator to confirm that all 15 employee records had been created correctly, with the Personalize List Columns option used to arrange Employee ID, Employee Name, Email, Department and Location in a readable order.

- Make sure you rearrange the fields accordingly by using Personalised List Columns

Click on OK

Final Result:
All the records are successfully imported into the ServiceNow system with Import Set, Transform Map.

All 15 employee records successfully created in the Employee Test table, with columns arranged via Personalize List Columns.

Result

Processed: 15, Inserts: 15, Updates: 0, Errors: 0 - the spreadsheet was fully and correctly imported into the Employee Test table on the first run.
