Project: Import Data using Transform Maps (Spreadsheet)

Platform: ServiceNow | Document: Phase 6 - Project Testing

Phase 6: Project Testing

Test Objective

Verify that the import pipeline correctly avoids duplicate records when the same employees are re-imported, and correctly inserts only genuinely new records - using the Coalesce feature on the Transform Map.

Test Setup: Enabling Coalesce

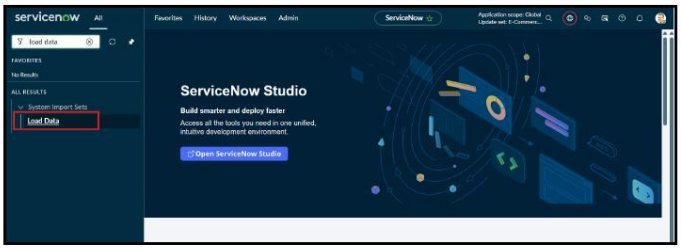

- Opened the Transform Map 'Sample Spreadsheet Import' under Transform Maps.
- In the Field Maps related list, set Coalesce = true on the Employee ID field (previously false).
- Saved the Transform Map.

PHASE 7 : Inserting New Data In Excel Format

Steps :

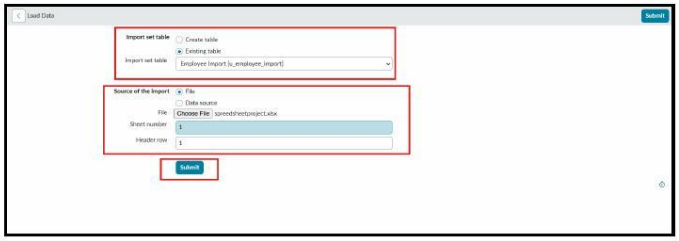

- Navigate to All menus.
- Search for Load data Under System Import set Open Load Data.
- Fill the details as
- Import set table as select Existing table {Employee Import}.
- Source of Import is Select File and choose the file from Files.
- Sheet number : 1, Header row : 1.
- Now Click submit.

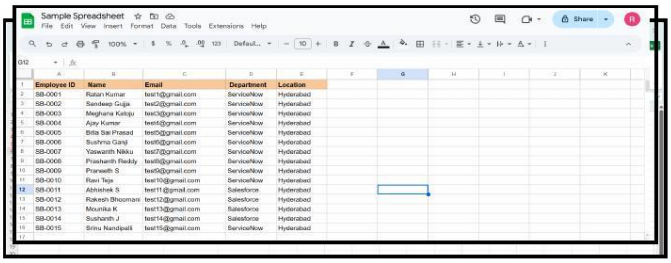

Field Maps for the Transform Map, with the Employee ID row's Coalesce value set to true.

Test Case 1: Mixed update + insert

A revised spreadsheet was uploaded containing the original 15 employees plus changes: one employee's email was changed, one employee's name was changed, and two brand-new employee rows were added (4 changed/new rows in total).

- Newly Created Excel Data is this.

- It is the previously added data.
- Now, In this new data we added 4 rows of the 2 rows with the same existing data with different Name changed and Email changed.
- That Raviteja Employee Email was Changed to [test10@gmail.com → test18@gmail.com].
- And Employee ID with SB-OOO4 name was changed to [Ajay kumar → Ajay].
- And two other new Employee ID's are added.
- Now after submitting the form it appears as State Completed and Success.

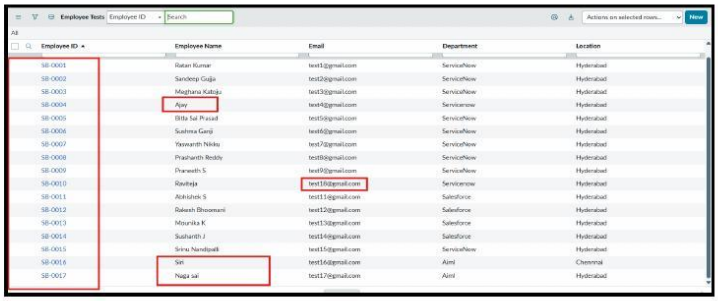

Re-running Load Data against the existing Employee Import staging table with the revised spreadsheet.

Result: Processed 4, Inserts 2 (the two new employees), Updates 2 (the two changed employees), Errors 0 - confirming Coalesce correctly matched existing Employee IDs and updated them instead of duplicating.

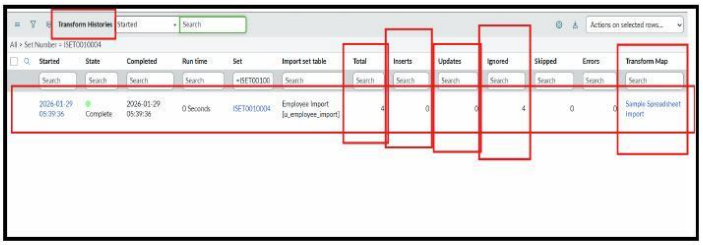

Test Case 2: Re-running the identical file

The same spreadsheet was submitted again unchanged, and the Transform was re-run against it.

- From the above figure : total 4 rows are uploaded out of 2 are Inserted that are two new ID's.
- And 2 rows are updates that are Same ID's with different Name and different Email that we changed.
- Then Open the Employee Tests table and see the rows updated and inserted.

- Now Repeat the Phase 7 with the same steps and same Excel sheet and Submit to check how many rows are updated and Inserted with the same data.
- Then Open the Transform history to check.

- Here we can see the total 4 are uploaded.
- On that 0 rows are Inserted and updates 0 and Ignored 4 rows.
- That same sheet we uploaded to the same transform map we created.

Transform History showing Total 4, Inserts 0, Updates 0, Ignored 4 - no duplicates were created on the repeat run.

Result: Total 4, Inserts 0, Updates 0, Ignored 4 - proving that once records exist, re-importing identical data neither duplicates nor unnecessarily updates them.

Test Conclusion

Coalesce on the Employee ID field behaved as expected across both test cases: new records are inserted, changed records are updated in place, and unchanged repeat records are safely ignored.
